イロト イポト イヨト イヨト

э

The Extended Kalman Filter (EKF)

Properties

- The model is not assumed to be perfect
- Model integrations are carried out forward in time with the nonlinear model for the state estimate and
- Forward and backward in time with the tangent linear model and the adjoint model, respectively, for updating the prediction error covariance matrix
- There is no minimization, just matrix products and inversions
- Computational cost of EKF is prohibitive, because P^f(t_i) and P^a(t_i) are huge full matrices

3D Variational Assimilation (3D-Var) 4D Variational Assimilation (4D-Var) The Extended Kalman Filter (EKF) **The Variational Kalman Filter (VKF)**

The Variational Kalman Filter (VKF)

Algorithm

Iterate in time

Step 0: Select an initial guess $\mathbf{x}^{a}(t_{0})$ and a covariance $\mathbf{P}^{a}(t_{0})$, and set i = 1.

Step 1: Compute the evolution model state estimate and the prior covariance estimate: (*i*) Compute $\mathbf{x}^{t}(t_{i}) = M(t_{i}, t_{i-1})(\mathbf{x}^{a}(t_{i-1}));$ (*ii*) **Minimize**

$$(\mathbf{P}^{f}(t_{i}))^{-1} = (\mathbf{M}_{i}\mathbf{P}^{a}(t_{i-1})\mathbf{M}_{i}^{\mathrm{T}} + \mathbf{Q})^{-1}$$

by the LBFGS method - or CG, as in incremental 4DVar;

3D Variational Assimilation (3D-Var) 4D Variational Assimilation (4D-Var) The Extended Kalman Filter (EKF) **The Variational Kalman Filter (VKF)**

イロト イポト イヨト イヨト

The Variational Kalman Filter (VKF)

Algorithm

Step 2: Compute the Variational Kalman filter state estimate and the posterior covariance estimate: (i) Minimize $\lambda(\mathbf{x}^{a}(t_{i})|\mathbf{y}_{i}^{o})$ $=(\mathbf{y}_{i}^{o}-\mathbf{H}_{i}\mathbf{x}^{a}(t_{i}))^{\mathrm{T}}\mathbf{R}^{-1}(\mathbf{y}_{i}^{o}-\mathbf{H}_{i}\mathbf{x}^{a}(t_{i}))$ $+(\mathbf{x}^{f}(t_{i})-\mathbf{x}^{a}(t_{i}))^{\mathrm{T}}(\mathbf{P}^{f}(t_{i}))^{-1}(\mathbf{x}^{f}(t_{i})-\mathbf{x}^{a}(t_{i}))$ by the LBFGS method - or CG, as in incremental 3DVar; (ii) Store the result of the minimization as a VKF estimate $\mathbf{x}^{a}(t_{i})$; (iii) Store the limited memory approximation to $\mathbf{P}^{a}(t_{i})$; **Step 3:** Update t := t + 1 and return to Step 1.

3D Variational Assimilation (3D-Var) 4D Variational Assimilation (4D-Var) The Extended Kalman Filter (EKF) **The Variational Kalman Filter (VKF)**

イロト イポト イヨト イヨト

The Variational Kalman Filter (VKF)

- Step 1(ii) is carried out with an auxiliary minimization that has a trivial solution but a random initial guess, and thereby generates a non-trivial minimization sequence
- P^f(t_i) and P^a(t_i) are kept in vector format, as a weighted sum of a diagonal or sparse background B₀, a diagonal model error variance matrix Q and a low rank dynamical component P^f(t_i) that
- Is obtained from the Hessian update formula of the Limited Memory BFGS iteration
- The Kalman gain matrix is not needed

3D Variational Assimilation (3D-Var) 4D Variational Assimilation (4D-Var) The Extended Kalman Filter (EKF) **The Variational Kalman Filter (VKF)**

イロト イヨト イヨト

The Variational Kalman Filter (VKF)

Properties

- The model is not assumed to be perfect
- Model integrations are carried out forward in time with the nonlinear model for the state estimate and
- Forward and backward in time for updating the prediction error covariance matrix
- There are no matrix inversions, just matrix products and minimizations
- Computational cost of VKF is similar to 4D-Var
- Minimizations are sequantial
- Accuracy of analyses similar to EKF

Ensemble Kalman Filters (EnKF) The Variational Ensemble Kalman Filter (VEnKF)

Ensemble Kalman Filters (EnKF) The Variational Ensemble Kalman Filter (VEnKF)

イロト イポト イヨト イヨト

1

Ensemble Kalman Filters (EnKF)

Properties

- Ensemble Kalman Filters are generally simpler to program than variational assimilation methods or EKF, because
- EnKF codes are based on just the non-linear model and do not require tangent linear or adjoint codes, but they
- Tend to suffer from slow convergence and therefore inaccurate analyses because ensemble size is small compared to model dimension
- Often underestimate analysis error covariance

Ensemble Kalman Filters (EnKF) The Variational Ensemble Kalman Filter (VEnKF)

イロト イポト イヨト イヨト 三日

Ensemble Kalman Filters (EnKF)

Properties

- Ensemble Kalman filters often base analysis error covariance on **bred vectors**, i.e. the difference between ensemble members and the background, or the ensemble mean
- One family of EnKF methods is based on perturbed observations, while
- Another family uses explicit linear transforms to build up the ensemble

Ensemble Kalman Filters (EnKF) The Variational Ensemble Kalman Filter (VEnKF)

EnKF Cost functions

Algorithm

Minimize

$$(\mathbf{P}^{f}(t_{i}))^{-1} = (\beta \mathbf{B}_{0} + (1-\beta)\frac{1}{N}\mathbf{X}^{f}(t_{i})\mathbf{X}^{f}(t_{i})^{\mathrm{T}})^{-1}$$

Algorithm

Minimize

$$\ell(\mathbf{x}^{a}(t_{i})|\mathbf{y}_{i}^{o})$$

$$= (\mathbf{y}_{i}^{o} - H(\mathbf{x}^{a}(t_{i})))^{\mathrm{T}}\mathbf{R}^{-1}(\mathbf{y}_{i}^{o} - H(\mathbf{x}^{a}(t_{i})))$$

$$+ \frac{1}{N}\sum_{j=1}^{N} (\mathbf{x}_{j}^{f}(t_{i}) - \mathbf{x}^{a}(t_{i}))^{\mathrm{T}}(\mathbf{P}^{f}(t_{i}))^{-1}(\mathbf{x}_{j}^{f}(t_{i}) - \mathbf{x}^{a}(t_{i}))$$

Ensemble Kalman Filters (EnKF) The Variational Ensemble Kalman Filter (VEnKF)

イロン イボン イヨン イヨン

The Variational Ensemble Kalman Filter (VEnKF)

Algorithm

Iterate in time

Step 0: Select a state $\mathbf{x}^{a}(t_{0})$ and a covariance $\mathbf{P}^{a}(t_{0})$ and set i = 1

Step 1: Evolve the state and the prior covariance estimate: (i) Compute $\mathbf{x}^{f}(t_{i}) = M(t_{i}, t_{i-1})(\mathbf{x}^{a}(t_{i-1}));$ (ii) Compute the ensemble forecast $\mathbf{X}^{f}(t_{i}) = M(t_{i}, t_{i-1})(\mathbf{X}^{a}(t_{i-1}));$ (iii) **Minimize** from a random initial guess $(\mathbf{P}^{f}(t_{i}))^{-1} = (\beta \mathbf{B}_{0} + (1 - \beta) \frac{1}{N} \mathbf{X}^{f}(t_{i}) \mathbf{X}^{f}(t_{i})^{T} + \mathbf{Q}_{i})^{-1}$ by the LBFGS method;

Ensemble Kalman Filters (EnKF) The Variational Ensemble Kalman Filter (VEnKF)

The Variational Ensemble Kalman Filter (VEnKF)

Algorithm

Step 2: Compute the Variational Ensemble Kalman Filter posterior state and covariance estimates: (i) Minimize $\ell(\mathbf{x}^{a}(t_{i})|\mathbf{y}_{i}^{o})$ $= (\mathbf{y}_{i}^{o} - H(\mathbf{x}^{a}(t_{i})))^{\mathrm{T}}\mathbf{R}^{-1}(\mathbf{y}_{i}^{o} - H(\mathbf{x}^{a}(t_{i})))$ $+(\mathbf{x}^{f}(t_{i}) - \mathbf{x}^{a}(t_{i}))^{\mathrm{T}}(\mathbf{P}^{f}(t_{i}))^{-1}(\mathbf{x}^{f}(t_{i}) - \mathbf{x}^{a}(t_{i})))$ by the LBFGS method;

> (ii) Store the result of the minimization as $\mathbf{x}^{a}(t_{i})$; (iii) Store the limited memory approximation to $\mathbf{P}^{a}(t_{i})$; (iv) Generate a new ensemble $\mathbf{X}^{a}(t_{i}) \sim N(\mathbf{x}^{a}(t_{i}), \mathbf{P}^{a}(t_{i}))$;

Step 3: Update i := i + 1 and return to Step 1.

Ensemble Kalman Filters (EnKF) The Variational Ensemble Kalman Filter (VEnKF)

The Variational Ensemble Kalman Filter (VEnKF)

Properties

- Follows the algorithmic structure of VKF, separating the time evolution from observation processing.
- A new ensemble is generated every observation step
- Bred vectors are centered on the mode, not the mean, of the ensemble, as in Bayesian estimation
- Like in VKF, a new ensemble and a new error covariance matrix is generated at every observation time
- No covariance leakage
- No tangent linear or adjoint code
- Asymptotically equivalent to VKF and therefore EKF when ensemble size increases

The Shallow Water Equations - Dam Break Experiment Laboratory and numerical geometry

The Shallow Water Model - 2

- U is the depth-averaged x-direction velocity
- V is the depth-averaged y-direction velocity
- η is the free surface elevation
- g is the gravitational constant
- ϵ is the horizontal eddy viscosity coefficient
- γ_T is the wind stress coefficient
- *U_a* and *V_a* are the reference wind components for top boundary friction
- H is the total water depth
- C_z is the Chezy coefficient for bottom friction
- f is the Coriolis parameter

Conclusions

The Shallow Water Equations - Dam Break Experiment Laboratory and numerical geometry

< □ > < 同 > < 回 > < 回

The Dam Break laboratory experiment

- The 400 m long river stretch has been scaled down to 21.2 m
- Water depth is 0.20 m above the dam
- The dam is placed at the most narrow point of the river
- The riverbed downstream from the dam is initially dry
- In the experiment the dam is broken instantly and a flood wave sweeps downstream
- The total duration of the laboratory experiment is 130 seconds

The Shallow Water Equations - Dam Break Experiment Laboratory and numerical geometry

イロト イ理ト イヨト イヨト

The observations

- The flow is measured with eight wave meters for water depth, placed irregularly at the approximate flume mid-line up and downstream from the dam
- Wave meters report the depth of water at 1 Hz, so with 1 s time intervals
- Computational time step is 0.103 s

4 Conclusions

・ 同 ト ・ ヨ ト ・ ヨ ト

Conclusions - 1

- From earlier results with the Lorenz '95 model:
- VEnKF is asymptotically as good as EKF or VKF in forecast skill, but can be run without an adjoint code
- VEnKF attains equal quality to EKF only on large ensemble sizes, but
- VEnKF performs better than EnKF especially with small ensemble size
- VEnKF has proven to be able to compensate for model error in Shallow Water simulations

・ 同 ト ・ ヨ ト ・ ヨ ト

Conclusions - 2

- Generating a new ensemble every time step is optimal, because
- The more frequent the inter-linked updates of the ensemble and the error covariance estimate, the more accurate the analysis
- There appears to be a trade-off between the accuracy of an assimilation method and its parallelism that needs to be decided by experiments
