# Real-time thermal comfort measurements in Amsterdam

UTCI=27.5 T=27.4 Td=14.4 Tmrt=32.1 u=1.2

UTCI=31.0 T=27.9 Td=14.6 Tmrt=57.0 u=3.0

Universal Thermal Climate Index (UTCI) scale: [www.utci.org](http://www.utci.org)

# Real-time thermal comfort measurements in Amsterdam

UTCI=37.1 T=28.9 Td=15.0 Tmrt=61.4 u=0.4

UTCI=34.8 T=28.1 Td=15.0 Tmrt=57.6 u=1.1

# Real-time thermal comfort measurements in Amsterdam

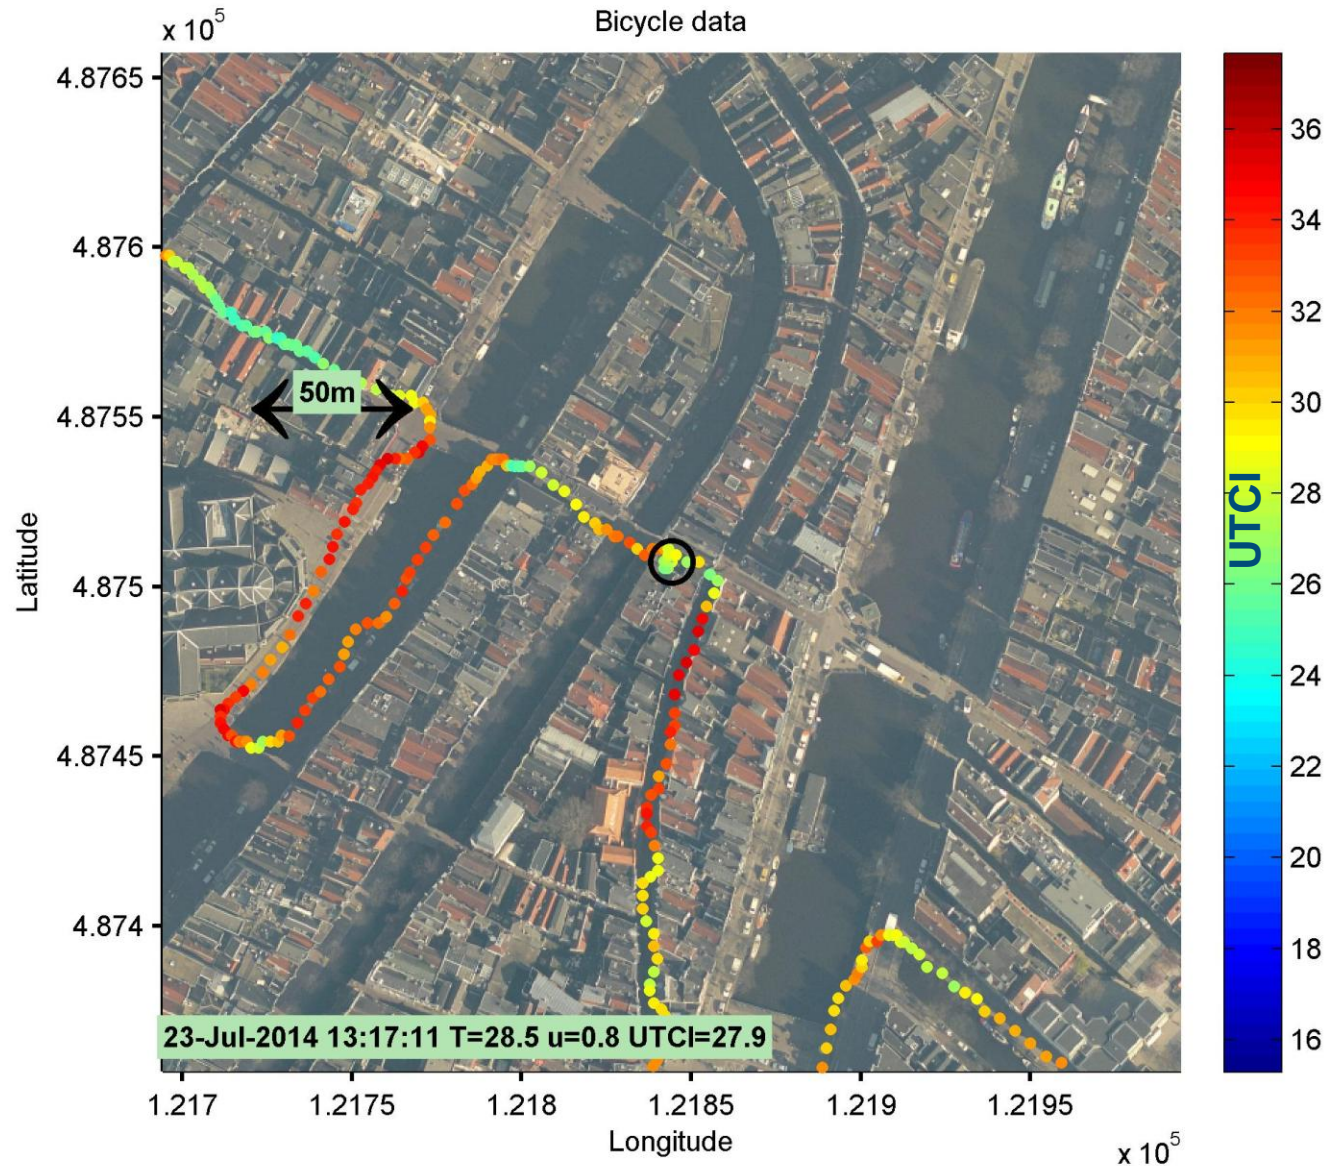

UTCI=29.8 T=28.1 Td=15.1 Tmrt=37.9 u=1.0

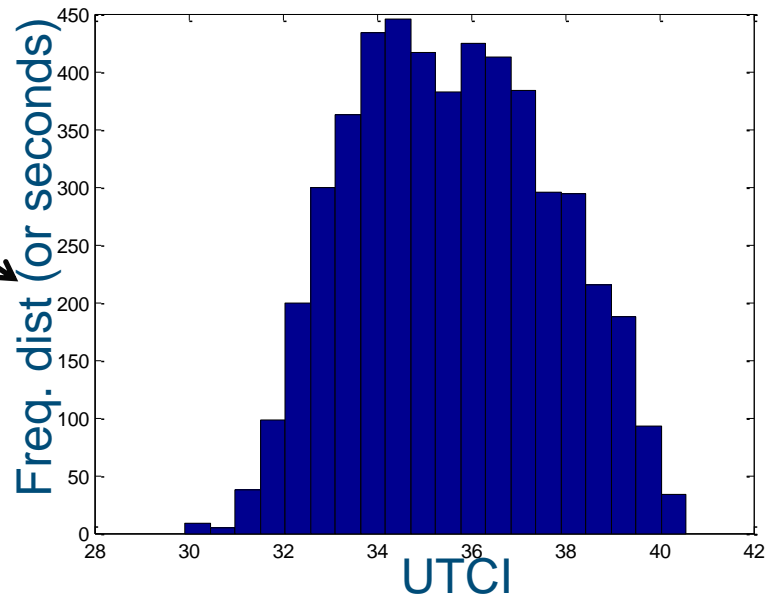

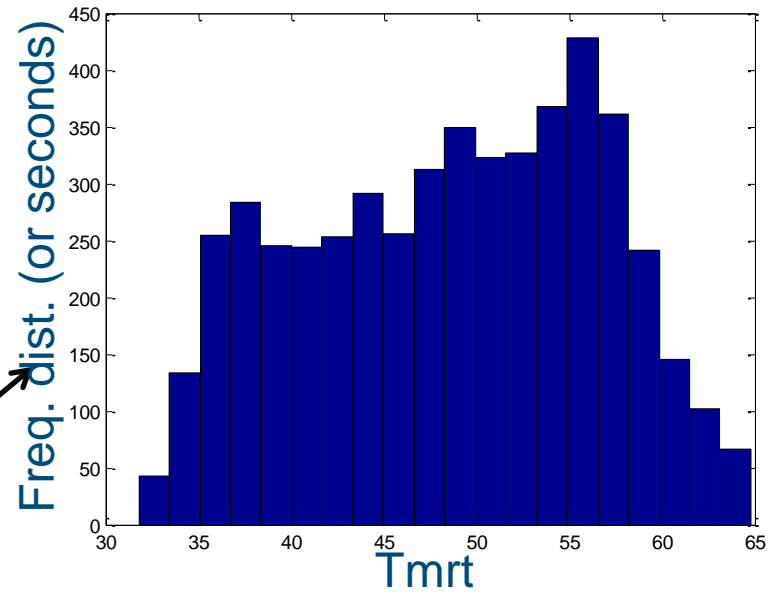

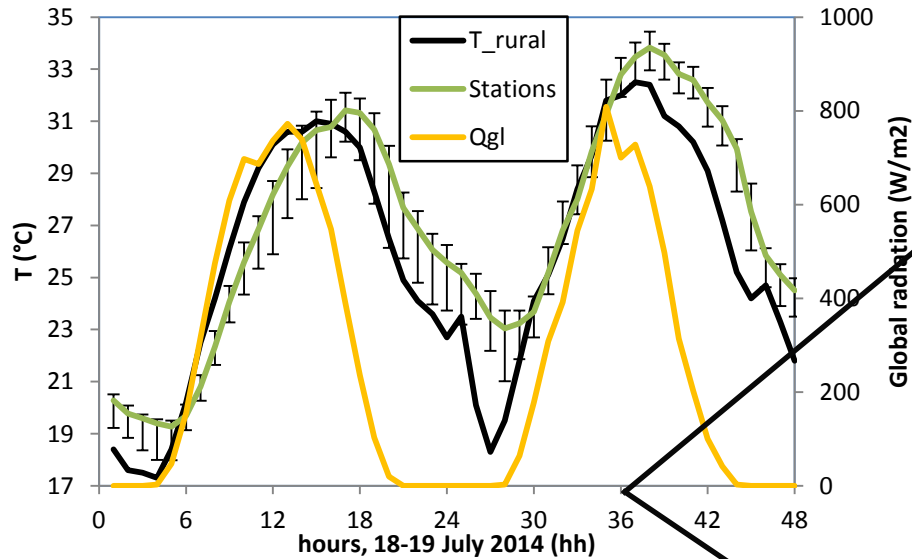

UTCI=28.1 T=28.2 Td=15.1 Tmrt=28.6 u=0.4

# Real-time thermal comfort measurements in Amsterdam

# Amsterdam (18-19 July 2014)

19 July 11:00-12:22

(Moderate to very strong heatstress)

# App development: Forecasting Thermal comfort in a complex environment

The idea is to present a location specific 3 h weather forecast of human thermal comfort up to 36 h ahead.

## Requirements:

- Use of a modern thermal comfort scale:  
UTCI (Universal Thermal Climate Index)
- No numbers (only a colour scale)
- Thermal stress levels as text (UTCI scale)
- Includes land-use effects (temperature, wind speed, radiation)

## Based on:

- Thermal comfort measurements/analysis: Bert Heusinkveld, session NONTM11
- WRF simulation: Reinder Ronda, session TUKUP4
- Land-use map 25 m resolution: Jisk Attema, session GD5
- Global model forecast: GFS, NCEP, U.S.A.
- Technical realisation: Master student Gert Sterenberg

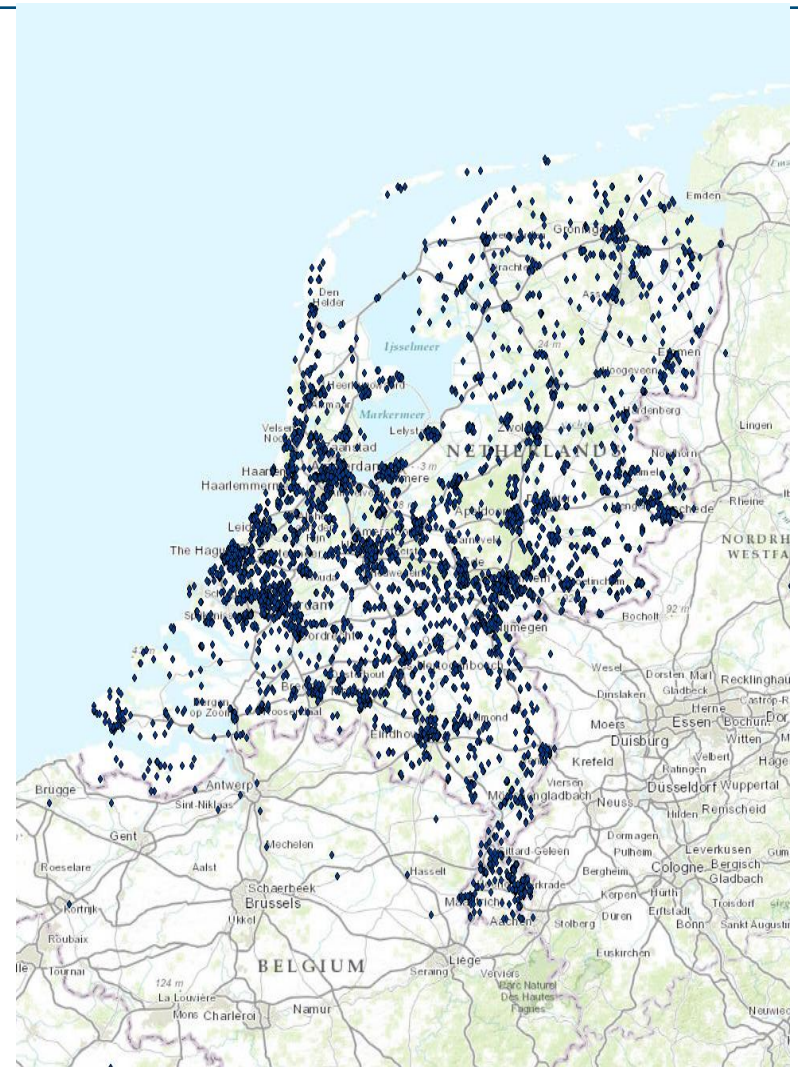

# App Thermal comfort

1. Use location data Smartphone
2. Download forecast
3. Display forecast
  - Add symbol sun
  - Wind/obstructed

# App: Thermal comfort

# Concluding remarks

---

Urban space during heat wave conditions:

- *Amsterdam has a substantial nocturnal urban heat island effect (canals don't help)*
- *Thermal comfort varies strongly among built up areas*
- *Parks with short vegetation are urban hot spots (during daytime)*
- *Narrow street canyons can be more thermally comfortable than a WMO weather station location (air temperature and UTCI)*

Thank you for your attention!
